

# CS 405/605 Data Science

Dr. Qianqian Tong

#### Course Schedule

Week 13: April 3 topic: Random Forest

April 5 topic: Validation

Project stage IV and V released, and the ddl will be April 28.

Week 14: April 10 topic: PCA

April 12 topic: Clustering-Kmeans

Week 15: April 17 topic: Visualization

April 19 topic: Visualization

HW3 will be released, and the ddl will be April 28.

Week 16: April 24 Project Presentation (4 groups, each will have 15-20 min)

April 26 Project Presentation (4 groups, each will have 15-20 min)

All reports and homework must be submitted by April 28, and graded by the final week.

# Big & High-Dimensional Data

• High-Dimensions = Lot of Features

#### Document classification

Features per document = thousands of words/unigrams millions of bigrams, contextual information

#### Surveys - Netflix

480189 users x 17770 movies

	movie 1	movie 2	movie 3	movie 4	movie 5	movie 6
Tom	5	?	?	1	3	?
George	?	?	3	1	2	5
Susan	4	3	1	?	5	1
Beth	4	3	?	2	4	2

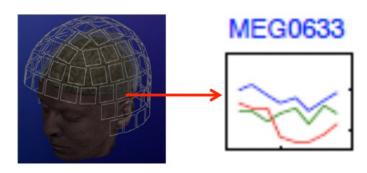

# Big & High-Dimensional Data

High-Dimensions = Lot of Features

#### **MEG Brain Imaging**

120 locations x 500 time points x 20 objects

Or any high-dimensional image data

Big & High-Dimensional Data

Useful to learn lower dimensional representations of the data.

Dimensionality reduction

- Today we'll cover an unsupervised learning algorithm: principal component analysis (PCA)
- Dimensionality reduction: map the data to a lower dimensional space
  - Save computation/memory
  - Reduce overfitting
  - Visualize data of high dimensionality
- PCA is a linear model, with a closed-form solution. It's useful for understanding lots of other algorithms.
  - Autoencoders
  - Matrix factorizations
  - Image compression
  - Face recognition
  - Gene expression analysis
- Today's lecture is very linear-algebra-heavy.
  - Especially orthogonal matrices and eigendecompositions.
  - Don't worry if you don't get it immediately -- next few lectures won't build on it

## Motivation

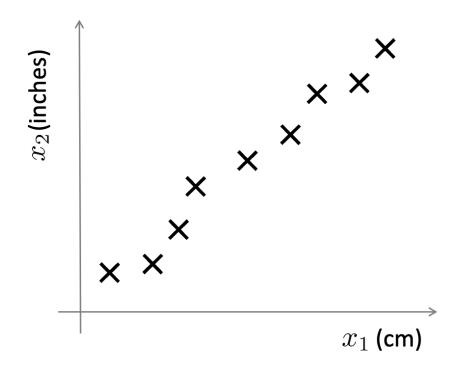

- Dimensionality reduction
  - To simplify complex high-dimensional data
  - Summarize data with a lower dimensional real valued vector

- Given data points in d dimensions
- Convert them to data points in r<d dimensions</li>
- With minimal loss of information

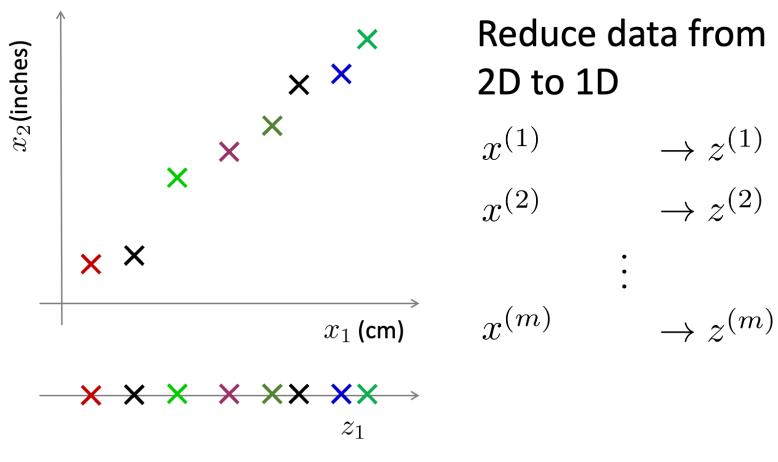

## **Data Compression**

Reduce data from 2D to 1D

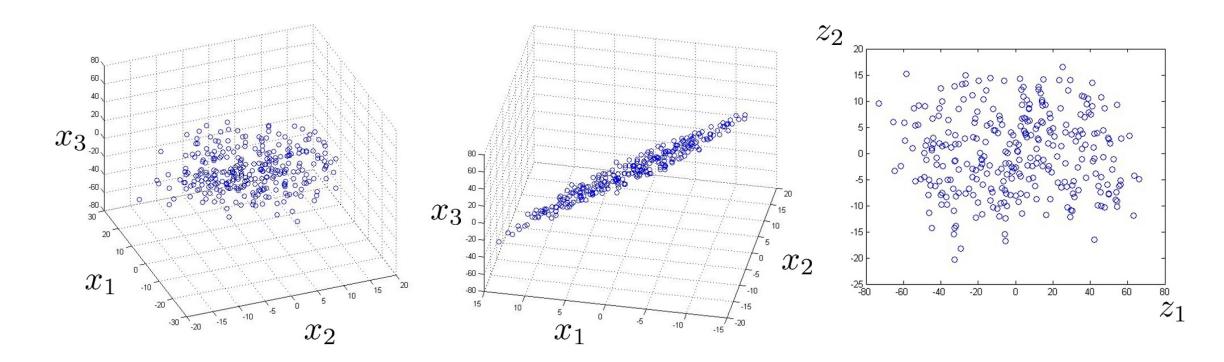

## **Data Compression**

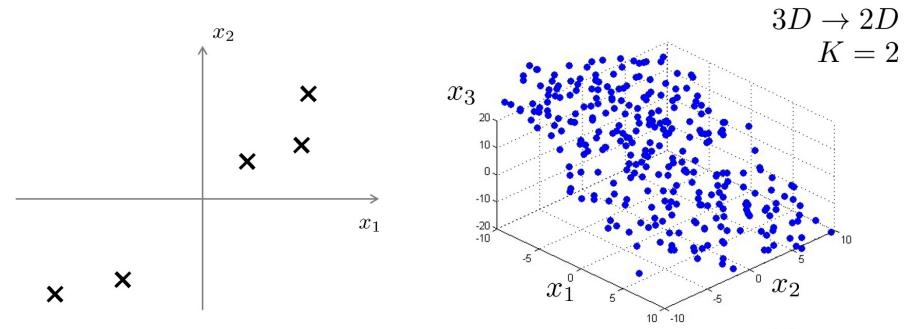

## **Data Compression**

#### Reduce data from 3D to 2D

#### Principal Component Analysis (PCA) problem formulation

Reduce from 2-dimension to 1-dimension: Find a direction (a vector  $u^{(1)} \in \mathbb{R}^n$ ) onto which to project the data so as to minimize the projection error.

Reduce from n-dimension to k-dimension: Find k vectors  $u^{(1)}, u^{(2)}, \ldots, u^{(k)}$  onto which to project the data, so as to minimize the projection error.

#### **Definition:**

Choosing a subspace to maximize the projected variance, or minimize the reconstruction error, is called principal component analysis (PCA).

#### Principal Component Analysis

**Goal:** Find r-dim projection that best preserves variance

- 1. Compute mean vector  $\mu$  and covariance matrix  $\Sigma$  of original points
- 2. Compute eigenvectors and eigenvalues of  $\Sigma$
- 3. Select top r eigenvectors
- 4. Project points onto subspace spanned by them:

$$y = A(x - \mu)$$

where y is the new point, x is the old one, and the rows of A are the eigenvectors

- Variance and Covariance:
  - Measure of the "spread" of a set of points around their center of mass(mean)
- Variance:
  - Measure of the deviation from the mean for points in one dimension
- Covariance:
  - Measure of how much each of the dimensions vary from the mean with respect to each other

## one attribute first

- Question: how much spread is in the data along the axis? (distance to the mean)
- Variance=Standard deviation^2

$s^2 =$	$\sum_{i=1}^{n} (X_i - \overline{X})^2$
s –	(n-1)

42 40 24 30 15 18 15 30 15 30 35 30 40 30	Temperature

40		35
		30
30		40
		30

## Now consider two dimensions

X=Temperature

Covariance: measures the correlation between X and Y

• cov(X,Y)=0: independent

•Cov(X,Y)>0: move same dir

•Cov(X,Y)<0: move oppo dir

cov(X,Y) =	$\sum_{i=1}^{n} (X_i - \overline{X})(Y_i - \overline{Y})$
COV(X,T) = 0	(n-1)

30	70
30	90
40	70
30	90

Y=Humidity

## More than two attributes: covariance matrix

 Contains covariance values between all possible dimensions (=attributes):

$$C^{nxn} = (c_{ij} \mid c_{ij} = \text{cov}(Dim_i, Dim_j))$$

• Example for three attributes (x,y,z):

$$C = \begin{pmatrix} cov(x, x) & cov(x, y) & cov(x, z) \\ cov(y, x) & cov(y, y) & cov(y, z) \\ cov(z, x) & cov(z, y) & cov(z, z) \end{pmatrix}$$

- Variance and Covariance:
  - Measure of the "spread" of a set of points around their center of mass(mean)
- Variance:
  - Measure of the deviation from the mean for points in one dimension
- Covariance:
  - Measure of how much each of the dimensions vary from the mean with respect to each other

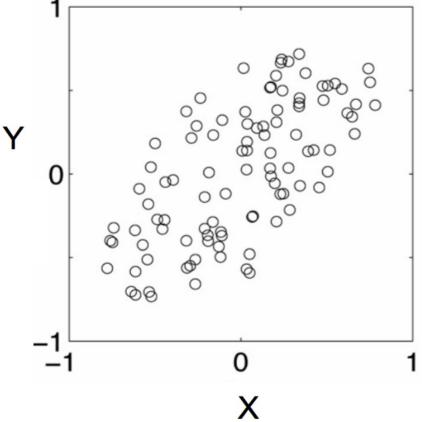

- Covariance is measured between two dimensions
- Covariance sees if there is a relation between two dimensions
- Covariance between one dimension is the variance

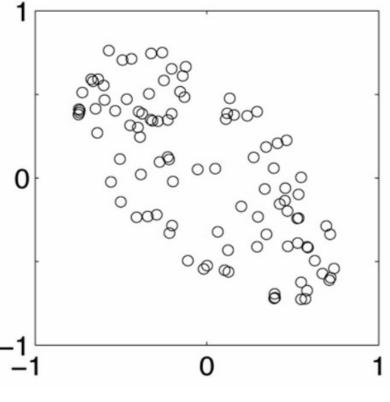

## Covariance

## positive covariance

# negative covariance

**Positive: Both dimensions increase** or decrease together

**Negative: While one increase the other decrease** 

## Eigenvector and Eigenvalue

## $Ax = \lambda x$

A: Square Matrix

λ: Eigenvector or characteristic vector

X: Eigenvalue or characteristic value

Vectors X having same direction as Ax

## Eigenvector and Eigenvalue

## $Ax = \lambda x$

- $A\mathbf{x} = \lambda \mathbf{x} \Leftrightarrow (A \lambda \mathbf{I}) \mathbf{x} = 0$
- How to calculate x and λ:
  - Calculate  $det(A-\lambda I)$ , yields a polynomial (degree n)
  - Determine roots to  $det(A-\lambda I)=0$ , roots are eigenvalues  $\lambda$
  - Solve  $(A-\lambda I)$  **x**=0 for each  $\lambda$  to obtain eigenvectors **x**

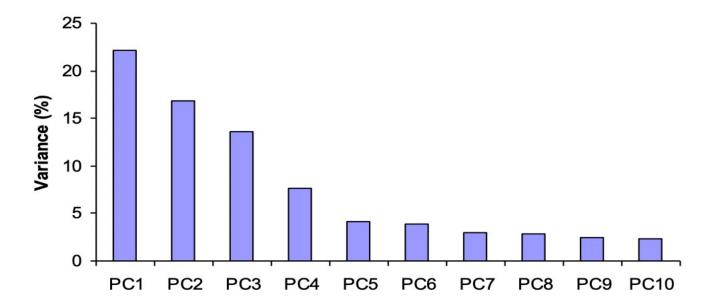

## Principal components

- 1. principal component (PC1)
  - The eigenvalue with the largest absolute value will indicate that the data have the largest variance along its eigenvector, the direction along which there is greatest variation
- 2. principal component (PC2)
  - the direction with maximum variation left in data, orthogonal to the 1. PC
- In general, only few directions manage to capture most of the variability in the data.

## Principal components

- How many principal components?
  - For n original dimensions, sample covariance matrix is nxn, and has up to n eigenvectors. So n PCs.
- Where does dimensionality reduction come from?
  - Can ignore the components of lesser significance.

## Principal components

- How many principal components?
  - For n original dimensions, sample covariance matrix is nxn, and has up to n eigenvectors. So n PCs.
- Where does dimensionality reduction come from?
  - Can ignore the components of lesser significance.
  - You do lose some information, but if the eigenvalues are small, you don't lose much
    - n dimensions in original data
    - calculate n eigenvectors and eigenvalues
    - choose only the first p eigenvectors, based on their eigenvalues
    - final data set has only p dimensions

#### **Definition:**

Choosing a subspace to maximize the projected variance, or minimize the reconstruction error, is called principal component analysis (PCA).

#### Principal Component Analysis

**Goal:** Find r-dim projection that best preserves variance

- 1. Compute mean vector  $\mu$  and covariance matrix  $\Sigma$  of original points
- 2. Compute eigenvectors and eigenvalues of  $\Sigma$
- 3. Select top r eigenvectors
- 4. Project points onto subspace spanned by them:

$$y = A(x - \mu)$$

where y is the new point, x is the old one, and the rows of A are the eigenvectors

#### Application: Image compression

Original Image

- Divide the original 372x492 image into patches:
  - Each patch is an instance that contains 12x12 pixels on a grid
- View each as a 144-D vector

PCA compression: 144D → 60D

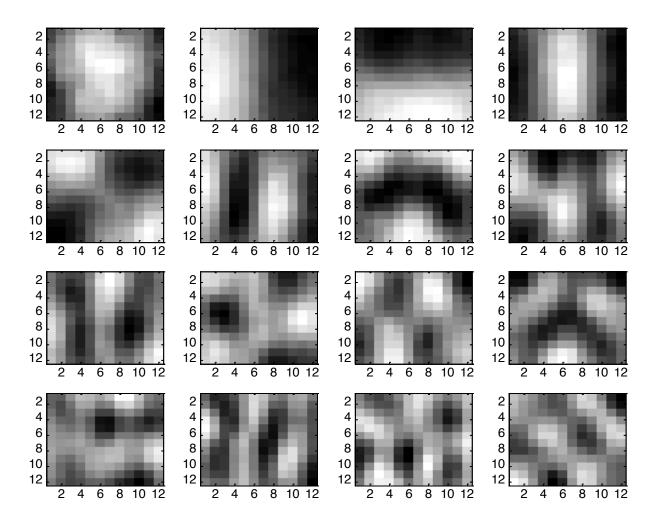

PCA compression: 144D → 16D

## 16 most important eigenvectors

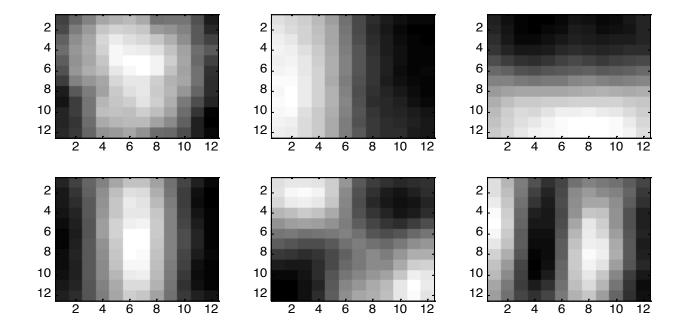

PCA compression: 144D → 6D

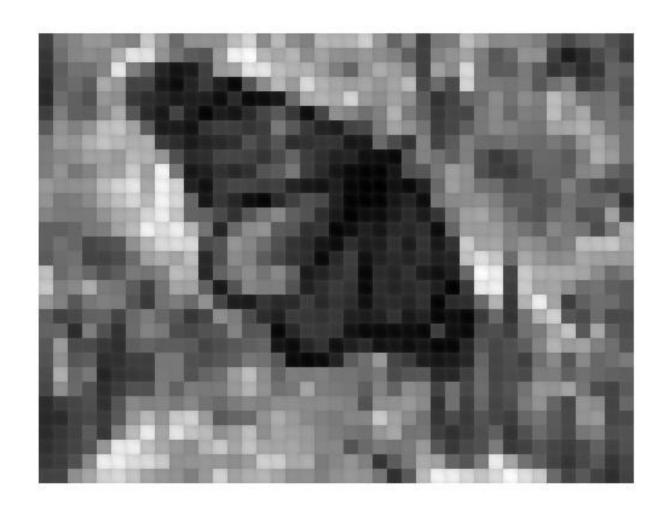

## 6 most important eigenvectors

PCA compression: 144D → 1D

# Dimensionality reduction

- PCA (Principal Component Analysis):
  - Find projection that maximize the variance
- ICA (Independent Component Analysis):
  - Very similar to PCA except that it assumes non-Gaussian features
- Multidimensional Scaling:
  - Find projection that best preserves inter-point distances
- LDA(Linear Discriminant Analysis):
  - Maximizing the component axes for class-separation
